

## **SET A**

Unique Paper Code: 12481302 (OC)

Name of the Paper: Statistics for Business Economics

Name of the Course: B. A. (Hons.) Business Economics

Semester: III (OC)

Duration: 3 hrs

Maximum Marks: 75

### **Instructions for Candidates**

1. Attempt any **four out of the given six** questions. All questions carry equal marks.
2. Use of simple calculator is allowed. Required statistical tables are attached with this paper.
3. All parts of the question must be done together.

1. a) A real estate agent has a set of 10 keys, one of which will open the front door of an apartment he wants to show to a potential buyer. If the 10 keys are tried in a completely random order, find the probability that:

- i) The first key opens the door.
- ii) All 10 keys are tried.

b) Consider following table:

	COVID-19- positive	COVID-19 negative	Total
Male	0.35	0.14	0.49
Female	0.40	0.11	0.51
Total	0.75	0.25	1

Find the probability that a randomly selected person is.

- (i) A male given that the person is COVID-19 positive

- (ii) Covid-19 positive given that the person is male.
- c) The sum of deviations of a certain number of observations from 12 is 166 while the sum of deviations of these observations from 16 is (-54). Find the number of observations and their mean.
- d) If  $X$  is a random variable having a normal distribution, what is the probability of getting a value within two standard deviation of the mean?
2. a) i) The mean of a certain number of observations is 20. If another observation, 25, is added to the data, the mean becomes 21. Find the number of observations in the original data.
- (ii) If the average monthly spending by 21 housewives in a locality was Rs 240, what is the new average spending if another housewife is added whose average monthly spending is 290?
- b) In going to watch a movie to the nearest theatre at Greater Kailash, I have to first get on a bus from my house and then transfer to a second bus. If waiting time at each bus stop has a uniform distribution with  $A = 0$  and  $B = 5$ , then it can be shown that the total waiting time  $Y$  has the pdf:
- $$f(y) = \begin{cases} \frac{1}{25}y & 0 \leq y < 5 \\ \frac{2}{5} - \frac{1}{25}y & 5 \leq y \leq 10 \\ 0 & y < 0 \text{ or } y > 10 \end{cases}$$
- What is the probability that the total waiting time is between 4 and 8 minutes?
- c) The distribution of mileage of a certain luxury car is known to be normal, with 10% of all luxury cars having mileage exceeding 10.256 miles/gallon and 5% having mileage less than 9.671 miles/gallon. What are the mean value and standard deviation of the mileage distribution of these luxury cars?
- d) On an average, 20 telephone calls per minute are received at a customer service centre of a leading clothing brand. If distribution of calls is Poisson, find the probability that in any given minute there will be more than 20 calls. What is the probability that there will be between 10 and 20 calls, inclusive? What is the probability that number of calls be within 2 standard deviation of the mean value?
3. a) Suppose 30% of all tennis rackets fail a certain strength test. Let  $X$  denote the number of tennis rackets selected from 15 randomly chosen rackets who fail the test. What is the probability that at most 8 rackets fail the test? What is the probability that exactly 8 rackets fail the test? Find the probability that between 4 and 7, inclusive fail the test.

b) Let X be a continuous random variable with the following cumulative distribution function (pdf):

$$f(x) = \begin{cases} 2(1 - \frac{1}{x^2}) & \text{for } 1 \leq x < 2 \\ 0 & \text{otherwise} \end{cases}$$

- (i) Compute the cdf of X
- (ii) Compute E(X) and V(X)
- c) You are given the following probability functions for x and y

$$g(x) = \frac{8}{x^3} \quad x > 2$$

$$h(y) = 2y \quad 0 < y < 1$$

- (i) What is the expected value of X?
- (ii) What is variance of Y?
- (iii) Define the correlation coefficient,  $\rho$ . How is it related to independence between two variables?

4. a) Calculate chain base index for the following data taking 1991 as base year.

Year	1991	1992	1993	1994	1995	1996
Price	40	50	52	56	60	68

b) i) A particular brand of sanitiser comes in three sizes: 25 ml, 40 ml, and 65 ml. 20% of all purchasers select a 25ml bottle, 50% select 40 ml bottle and the remaining select a 65 ml bottle. Let  $X_1$  and  $X_2$  be the bottle sizes selected by two independently selected customers. Determine the sampling distribution of  $\bar{X}$ . Calculate  $E(\bar{X})$  and compare it to  $\mu$ .

c) i)The amount of impurity in water supplied by municipality is a random variable with mean 4 grams and standard deviation 1.5 grams. If 50 batches of water are independently tested, what is the approximate probability that the sample average amount of impurity is between 3.2 grams and 4.2 grams? What assumption is used here?

(ii) If the sample size would have been 16 rather than 50, could the probability asked in part (i) be calculated from the information provided?

d) Show that the sample proportion  $X/n$  is an unbiased estimator of  $p$ , where  $X$  follows binomial distribution.

5. a) A publisher obtained a random sample of 23 books to determine their average cost. The cost of books is assumed to be normally distributed. If the mean cost of the sample of books was found to be Rs 23.56 and sample standard deviation was Rs 4.65, find

- (i) 98% confidence interval for the cost of a book
- (ii) How can the publishers make their result more reliable? Is there any loss associated with it?
- (iii) What sample size would be necessary for the CI to have a width of at the most 10?

b) The following are the index numbers of wholesale prices of a certain commodity:

Year	2012	2013	2014	2015	2016	2017
Index. no	100	118	128	156	220	260

Shift the base to 2014 and obtain new index numbers.

c) i) A certain brand of battery is claimed to have an average lifetime of 750 hours. Since the price of these batteries is favourable, a customer decides to purchase it unless it can be shown that the true average lifetime of batteries is smaller than what is claimed. A random sample of 50 batteries was selected and the average lifetime was found to be 738.44 hours with standard deviation of 38.20 hours. What conclusion would be appropriate for a significance level of 5%? Find out the p-value of the test.

(ii) Assuming normality, calculate a 99% CI for population variance when the sample variance is 25.368 and the sample size is 22.

6. a) Consider the two types of cotton fabrics, one with a thick texture (I) and other with a thin texture (II). The difference in textures come from the thread count of each fabric. A sample of 10 pieces of each fabric were examined and it was found that Type I has an average thread count of 51.71 with standard deviation of 0.79. Whereas type II cotton had a sample average thread count of 136.14 and a standard deviation of 3.59. Construct a 95% confidence interval for the difference between true average thread counts for fabric I and II. Assume that thread count distributions for both types of fabric is normal. What conclusion can you draw from this interval?

b) From the data on vitamin D readings in serology tests in younger men it was found that Vitamin D distribution in younger men had a smaller variance than in older adults. For a sample of 28 young men sample standard deviation was 52.6 and for 26 older men standard deviation was 84.2. Does this data support the conclusion as applied to men?

c) Of  $n_1$  randomly selected male smokers,  $X_1$  smoked filter cigarettes, whereas of  $n_2$  randomly selected female smokers,  $X_2$  smoked filter cigarettes. Let  $p_1$  and  $p_2$  denote the probabilities that a randomly selected male and female, respectively, smoke filter cigarettes.

- (i) Show that  $(X_1/n_1) - (X_2/n_2)$  is an unbiased estimator for  $p_1 - p_2$ .
- (ii) If  $n_1 = n_2 = 200$ ,  $x_1 = 127$ , and  $x_2 = 176$ , use the estimator of part (i) to obtain an estimate of  $p_1 - p_2$ .
